- NOTES: 1.  $A = \bar{A}_C + \bar{A}^* + A1 \cdot A2$ ,  $B = \bar{B}_C + \bar{B}^* + B1 \cdot B2$ .  
 2. When  $A^*$  is used as an input,  $A1$  or  $A2$  must be low. When  $B^*$  is used as an input,  $B1$  or  $B2$  must be low.  
 3. When  $A1$  and  $A2$  or  $B1$  and  $B2$  are used as inputs,  $A^*$  or  $B^*$ , respectively, must be open or used to perform dot-AND logic.

## description

These single-bit, high-speed, binary full adders with gated complementary inputs, complementary sum ( $\Sigma$  and  $\bar{\Sigma}$ ) outputs and inverted carry output are designed for medium-and high-speed, multiple-bit, parallel-add/serial-carry application. These circuits (see schematic) utilize diode-transistor logic (DTL) for the gated inputs, and high-speed, high-fan-out transistor-transistor logic (TTL) for the sum and carry outputs and are entirely compatible with the TTL logic families. The implementation of a single-inversion, high-speed, Darlington-connected serial-carry circuit minimizes the necessity for extensive "look-ahead" and carry-cascading circuits.
