# Digital TV Sound Processor (DTVSP)

TDA9870A

## 1 FEATURES

### 1.1 Demodulator and decoder section

- Sound IF (SIF) input switch e.g. to select between terrestrial TV SIF and SAT SIF sources
- SIF AGC with 24 dB control range
- SIF 8-bit Analog-to-Digital Converter (ADC)
- Two-carrier multistandard FM demodulation (B/G, D/K and M standard)
- Decoding for three analog multi-channel systems (A2, A2+ and A2\*) and satellite sound
- Programmable identification (B/G, D/K and M standard) and different identification times.

### 1.2 DSP section

- Digital crossbar switch for all digital signal sources and destinations
- Control of volume, balance, contour, bass, treble, pseudo stereo, spatial, bass boost and soft-mute
- Plop-free volume control
- Automatic Volume Level (AVL) control
- Adaptive de-emphasis for satellite
- Programmable beeper
- Monitor selection for FM/AM DC values and signals, with peak detection option
- I<sup>2</sup>S-bus interface for a feature extension (e.g. Dolby surround) with matrix, level adjust and mute.

### 1.3 Analog audio section

- Analog crossbar switch with inputs for mono and stereo (also applicable as SCART 3 input), SCART 1 input/output, SCART 2 input/output and line output
- User defined full-level/−3 dB scaling for SCART outputs
- Output selection of mono, stereo, dual A/B, dual A or dual B
- 20 kHz bandwidth for SCART-to-SCART copies
- Standby mode with functionality for SCART copies
- Dual audio Digital-to-Analog Converter (DAC) from DSP to analog crossbar switch, bandwidth of 15 kHz
- Dual audio ADC from analog inputs to DSP
- Two dual audio DACs for loudspeaker (Main) and headphone (Auxiliary) outputs; also applicable for L, R, C and S in the Dolby Pro Logic mode with feature extension.

## 2 GENERAL DESCRIPTION

The TDA9870A is a single-chip Digital TV Sound Processor (DTVSP) for analog multi-channel sound systems in TV sets and satellite receivers.

### 2.1 Supported standards

The multistandard/multi-stereo capability of the TDA9870A is mainly of interest in Europe, but also in Hong Kong/Peoples Republic of China and South East Asia. This includes B/G, D/K, I, M and L standard. In other application areas there exists only subsets of those standard combinations otherwise only single standards are transmitted.

M standard is transmitted in Europe by the American Forces Network (AFN) with European channel spacing (7 MHz VHF, 8 MHz UHF) and monaural sound.

Korea has a stereo sound system similar to Europe and is supported by the TDA9870A. Differences include deviation, modulation contents and identification. It is based on M standard.

An overview of the supported standards and sound systems and their key parameters is given in Table 1.

The analog multi-channel sound systems (A2, A2+ and A2\*) are sometimes also named 2CS (2-Carrier Systems).

## Digital TV Sound Processor (DTVSP)

TDA9870A

## 2.1.1 ANALOG 2-CARRIER SYSTEMS

**Table 1** Frequency modulation

STANDARD	SOUND SYSTEM	CARRIER FREQUENCY (MHz)	FM DEVIATION (kHz)			MODULATION		BANDWIDTH/ DE-EMPHASIS (kHz/ $\mu$ s)
			NOM.	MAX.	OVER	SC1	SC2	
M	mono	4.5	15	25	50	mono	–	15/75
M	A2+	4.5/4.724	15	25	50	$\frac{1}{2}(L + R)$	$\frac{1}{2}(L - R)$	15/75 (Korea)
B/G	A2	5.5/5.742	27	50	80	$\frac{1}{2}(L + R)$	R	15/50
I	mono	6.0	27	50	80	mono	–	15/50
D/K	A2	6.5/6.742	27	50	80	$\frac{1}{2}(L + R)$	R	15/50
D/K	A2*	6.5/6.258	27	50	80	$\frac{1}{2}(L + R)$	R	15/50

**Table 2** Identification for A2 systems

PARAMETER	A2/A2*	A2+ (KOREA)
Pilot frequency	54.6875 kHz = $3.5 \times$ line frequency	55.0699 kHz = $3.5 \times$ line frequency
Stereo identification frequency	117.5 Hz = $\frac{\text{line frequency}}{133}$	149.9 Hz = $\frac{\text{line frequency}}{105}$
Dual identification frequency	274.1 Hz = $\frac{\text{line frequency}}{57}$	276.0 Hz = $\frac{\text{line frequency}}{57}$
AM modulation depth	50%	50%

## Digital TV Sound Processor (DTVSP)

## TDA9870A

## 2.1.2 SATELLITE SYSTEMS

An important specification for satellite TV reception is the "Astra specification". The TDA9870A is suited for the reception of Astra and other satellite signals.

**Table 3** FM satellite sound

CARRIER TYPE	CARRIER FREQUENCY (MHz)	MODULATION INDEX	MAXIMUM FM DEVIATION (kHz)	MODULATION	BANDWIDTH/ DE-EMPHASIS (kHz/ $\mu$ s)
Main	6.50 <sup>(1)</sup>	0.26	85	mono	15/50 <sup>(1)</sup>
Sub	7.02/7.20	0.15	50	m/st/d <sup>(2)</sup>	15/adaptive <sup>(3)</sup>
Sub	7.38/7.56	0.15	50	m/st/d <sup>(2)</sup>	15/adaptive <sup>(3)</sup>
Sub	7.74/7.92	0.15	50	m/st/d <sup>(2)</sup>	15/adaptive <sup>(3)</sup>
Sub	8.10/8.28	0.15	50	m/st/d <sup>(2)</sup>	15/adaptive <sup>(3)</sup>

**Notes**

1. For other satellite systems, frequencies of, for example, 5.80, 6.60 or 6.65 MHz can also be received. A de-emphasis of 60  $\mu$ s, or in accordance with J17, is available.
2. m/st/d = mono or stereo or dual language sound.
3. Adaptive de-emphasis is compatible to transmitter specification.

## 6 FUNCTIONAL DESCRIPTION

### 6.1 Description of the demodulator and decoder section

#### 6.1.1 SIF INPUT

Two input pins are provided, SIF1 e.g. for terrestrial TV and SIF2 e.g. for a satellite tuner. For higher SIF signal levels the SIF input can be attenuated with an internally switchable  $-10$  dB resistor divider. As no specific filters are integrated, both inputs have the same specification giving flexibility in application. The selected signal is passed through an AGC circuit and then digitized by an 8-bit ADC operating at 24.576 MHz.

#### 6.1.2 AGC

The gain of the AGC amplifier is controlled from the ADC output by means of a digital control loop employing hysteresis. The AGC has a fast attack behaviour to prevent ADC overloads and a slow decay behaviour to prevent AGC oscillations. For AM demodulation the AGC must be switched off. When switched off, the control loop is reset and fixed gain settings can be chosen (see Table 14; subaddress 0).

The AGC can be controlled via the I<sup>2</sup>C-bus. Details can be found in the I<sup>2</sup>C-bus register definitions (see Chapter 10).

#### 6.1.3 MIXER

The digitized input signal is fed to the mixers, which mix one or both input sound carriers down to zero IF. A 24-bit control word for each carrier sets the required frequency. Access to the mixer control word registers is via the I<sup>2</sup>C-bus.

#### 6.1.4 FM AND AM DEMODULATION

An FM or AM input signal is fed via a band-limiting filter to a demodulator that can be used for either FM or AM demodulation. Apart from the standard (fixed) de-emphasis characteristic, an adaptive de-emphasis is available for encoded satellite programs. A stereo decoder recovers the left and right signal channels from the demodulated sound carriers. Both the European and Korean stereo systems are supported.

#### 6.1.5 FM IDENTIFICATION

The identification of the FM sound mode is performed by AM synchronous demodulation of the pilot signal and narrow-band detection of the identification frequencies. The result is available via the I<sup>2</sup>C-bus interface. A selection can be made via the I<sup>2</sup>C-bus for B/G, D/K and M standard and for three different modes that represent different trade-offs between speed and reliability of identification.

#### 6.1.6 CRYSTAL OSCILLATOR

The crystal oscillator (XO) is illustrated in Fig.8 (see Chapter 12). The circuitry of the XO is fully integrated, only the external 24.576 MHz crystal is needed.

#### 6.1.7 TEST PINS

Both test pins are active HIGH, in normal operation of the device they are connected to V<sub>SSD1</sub>. Test functions are for manufacturing tests only and are not available to customers. Without external circuitry these pads are pulled down to LOW level with internal resistors.

#### 6.1.8 POWER FAIL DETECTOR

The power fail detector monitors the internal power supply for the digital part of the device. If the supply has temporarily been lower than the specified lower limit, the power-on reset bit POR, transmitter register subaddress 0 (see Section 10.4.1), will be set to HIGH. The CLR<sub>POR</sub> bit, slave register subaddress 1 (see Section 10.3.2), resets the power-on reset flip-flop to LOW. If this is detected, an initialization of the TDA9870A has to be performed to ensure reliable operation.

TDA9870A

## 6.2 Description of the DSP

Fig.3 DSP data flow diagram.

## Digital TV Sound Processor (DTVSP)

## TDA9870A

### 6.2.1 LEVEL SCALING

All input channels to the digital crossbar switch (except for the loudspeaker feedback path) are equipped with a level adjust facility to change the signal level in a range of  $\pm 15$  dB. It is recommended to scale all input channels to be 15 dB below full scale ( $-15$  dB full scale) under nominal conditions.

### 6.2.2 FM (AM) PATH

A high-pass filter suppresses DC offsets from the FM demodulator, due to carrier frequency offsets, and supplies the monitor/peak function with DC values and an unfiltered signal, e.g. for the purpose of carrier detection.

The de-emphasis function offers fixed settings for the supported standards (50  $\mu$ s, 60  $\mu$ s and 75  $\mu$ s).

An adaptive de-emphasis is available for Wegener-Panda 1 encoded programs.

A matrix performs the dematrixing of the A2 stereo, dual and mono signals.

### 6.2.3 MONITOR

This function provides data words from a number of locations of the signal processing paths to the I<sup>2</sup>C-bus interface (2 data bytes). Signal sources include the FM demodulator outputs, most inputs to the digital crossbar switch and the outputs of the ADC. Source selection and data read-out is performed via the I<sup>2</sup>C-bus.

Optionally, the peak value can be measured instead of simply taking samples. The internally stored peak value is reset to zero when the data is read via the I<sup>2</sup>C-bus.

The monitor function may be used, for example, for signal level measurements or carrier detection.

### 6.2.4 LOUDSPEAKER (MAIN) CHANNEL

The matrix provides the following functions; forced mono, stereo, channel swap, channel 1, channel 2 and spatial effects.

There are fixed coefficient sets for spatial settings of 30%, 40% and 52%.

The Automatic Volume Level (AVL) function provides a constant output level of  $-23$  dB full scale for input levels between 0 and  $-29$  dB full scale. There are some fixed decay time constants to choose from, i.e. 2, 4 and 8 s.

Pseudo stereo is based on a phase shift in one channel via a 2nd-order all-pass filter. There are fixed coefficient sets to provide 90 degrees phase shift at frequencies of 150, 200 and 300 Hz.

Volume is controlled individually for each channel ranging from  $+24$  to  $-83$  dB with 1 dB resolution. There is also a mute position. For the purpose of a simple control software in the microcontroller, the decimal number that is sent as an I<sup>2</sup>C-bus data byte for volume control is identical to the volume setting in dBs (e.g. the I<sup>2</sup>C-bus data byte  $+10$  sets the new volume value to  $+10$  dB).

Balance can be realized by independent control of the left and right channel volume settings.

Contour is adjustable between 0 and  $+18$  dB with 1 dB resolution. This function is linked to the volume setting by means of microcontroller software.

Bass is adjustable between  $+15$  and  $-12$  dB with 1 dB resolution and treble is adjustable between  $\pm 12$  dB with 1 dB resolution.

For the purpose of a simple control software in the microcontroller, the decimal number that is sent as an I<sup>2</sup>C-bus data byte for contour, bass or treble is identical to the new contour, bass or treble setting in dBs (e.g. the I<sup>2</sup>C-bus data byte  $+8$  sets the new value to  $+8$  dB).

Extra bass boost is provided up to 20 dB with 2 dB resolution. The implemented coefficient set serves merely as an example on how to use this filter.

The beeper provides tones in a range from approximately 400 Hz to 30 kHz. The frequency can be selected via the I<sup>2</sup>C-bus. The beeper output signal is added to the loudspeaker and headphone channel signals. The beeper volume is adjustable with respect to full scale between 0 and  $-93$  dB with 3 dB resolution. The beeper is not effected by mute.

Soft mute provides a mute ability in addition to volume control with a well defined time (32 ms) after which the soft mute is completed. A smooth fading is achieved by a cosine masking.

### 6.2.5 HEADPHONE (AUXILIARY) CHANNEL

The matrix provides the following functions; forced mono, stereo, channel swap, channel 1 and channel 2 (or C and S in Dolby Surround Pro Logic mode).

Volume is controlled individually for each channel in a range from  $+24$  to  $-83$  dB with 1 dB resolution. There is also a mute position.

## Digital TV Sound Processor (DTVSP)

## TDA9870A

For the purpose of a simple control software in the microcontroller, the decimal number that is sent as an I<sup>2</sup>C-bus data byte for volume control is identical to the volume setting in dB (e.g. the I<sup>2</sup>C-bus data byte +10 sets the new volume value to +10 dB).

Balance can be realized by independent control of the left and right channel volume settings.

Bass is adjustable between +15 and -12 dB with 1 dB resolution and treble is adjustable between ±12 dB with 1 dB resolution.

For the purpose of a simple control software in the microcontroller, the decimal number that is sent as an I<sup>2</sup>C-bus data byte for bass or treble is identical to the new bass or treble setting in dB (e.g. the I<sup>2</sup>C-bus data byte +8 sets the new value to +8 dB).

The beeper provides tones in a range from approximately 400 Hz to 30 kHz. The frequency can be selected via the I<sup>2</sup>C-bus. The beeper output signal is added to the loudspeaker and headphone channel signals. The beeper volume is adjustable with respect to full scale between 0 and -93 dB with 3 dB resolution. The beeper is not effected by mute.

Soft mute provides a mute ability in addition to volume control with a well defined time (32 ms) after which the soft mute is completed. A smooth fading is achieved by a cosine masking.

### 6.2.6 FEATURE INTERFACE

The feature interface comprises two I<sup>2</sup>S-bus input/output ports and a system clock output. Each I<sup>2</sup>S-bus port is equipped with level adjust facilities that can change the signal level in a range of ±15 dB with 1 dB resolution. Outputs can be disabled to improve EMC performance.

The I<sup>2</sup>S-bus output matrix provides the following functions; forced mono, stereo, channel swap, channel 1 and channel 2.

One example of how the feature interface can be used in a TV set is to connect an external Dolby Surround Pro Logic DSP, such as the SAA7710, to the I<sup>2</sup>S-bus ports. Outputs must be enabled and a suitable master clock signal for the DSP can be taken from pin SYSCLK. A stereo signal from any source will be output on one of the I<sup>2</sup>S-bus serial data outputs and the four processed signal channels will be entered at both I<sup>2</sup>S-bus serial data inputs. Left and right could then be output to the power amplifiers via the Main channel, centre and surround via the Auxiliary channel.

### 6.2.7 CHANNEL FROM THE AUDIO ADC

The signal level at the output of the ADC can be adjusted in a range of ±15 dB with 1 dB resolution. The audio ADC itself is scaled to a gain of -6 dB.

### 6.2.8 CHANNEL TO THE ANALOG CROSSBAR PATH

Level adjust with control positions 0 dB, +3 dB, +6 dB and +9 dB.

### 6.2.9 DIGITAL CROSSBAR SWITCH (see Fig.6)

Input channels to the crossbar switch are from the audio ADC, I<sup>2</sup>S1, I<sup>2</sup>S2, FM path and from the loudspeaker channel path after matrix and AVL.

Output channels comprise loudspeaker, headphone, I<sup>2</sup>S1, I<sup>2</sup>S2 and the audio DACs for line output and SCART.

The I<sup>2</sup>S1 and I<sup>2</sup>S2 outputs also provide digital outputs from the loudspeaker and headphone channels, but without the beeper signals.

### 6.2.10 GENERAL

There are a number of functions that can provide signal gain, e.g. volume, bass and treble control. Great care has to be taken when using gain with large input signals in order not to exceed the maximum possible signal swing, which would cause severe signal distortion. The nominal signal level of the various signal sources to the digital crossbar switch should be 15 dB below digital full scale (-15 dB full scale). This means that a volume setting of, say, +15 dB would just produce a full scale output signal and not cause clipping, if the signal level is nominal.

Sending illegal data patterns via the I<sup>2</sup>C-bus will not cause any changes of the current setting for the volume, bass, treble, bass boost and level adjust functions.

### 6.2.11 EXPERT MODE

The TDA9870A provides a special expert mode that gives direct write access to the internal Coefficient RAM (CRAM) of the DSP. It can be used to create user-defined characteristics, such as a tone control with different corner frequencies or special boost/cut characteristics to correct the low-frequency loudspeaker and/or cabinet frequency responses by means of the bass boost filter. However, this mode must be used with great care.

More information on the functions of this device, such as the number of coefficients per function, their default values, memory addresses, etc., can be made available on request.

## 6.2.12 OVERVIEW OF DSP FUNCTIONS

**Table 4** Overview of DSP functions

FUNCTION	EXPERT MODE	PARAMETER	VALUE	UNIT
Bass control for loudspeaker and headphone output	yes	control range	-12 to +15	dB
		resolution	1	dB
		resolution at frequency	40	Hz
Treble control for loudspeaker and headphone output	yes	control range	-12 to +12	dB
		resolution	1	dB
		resolution at frequency	14	kHz
Contour for loudspeaker output	yes	control range	0 to +18	dB
		resolution	1	dB
		resolution at frequency	40	Hz
Bass boost for loudspeaker output	yes	control range	0 to +20	dB
		resolution	2	dB
		resolution at frequency	20	Hz
		corner frequency	350	Hz
Volume control for each separate channel in loudspeaker and headphone output	no	control range	-83 to +24	dB
		resolution	1	dB
		mute position at step	10101100	
Soft-mute for loudspeaker and headphone output	no	processing time	32	ms
Spatial effects	yes	anti-phase crosstalk positions	30, 40 and 52	%
Pseudo stereo	yes	90 degree phase shift at frequency	150, 200 and 300	Hz
Beeper additional to the signal in the loudspeaker and headphone channel	yes	beep frequencies	see Section 10.3.38	
		control range	0 to -93	dB
		resolution	3	dB
		mute position at step	00100000	
Automatic Volume Level (AVL)	yes	step width	quasi continuously	
		AVL output level for an input level between 0 and -29 dB full scale	-23	dBFS
		attack time	10	ms
		decay time constant	2, 4 and 8	s
General	no	-3 dB lower corner frequency of DSP	10	Hz
		-1 dB bandwidth of DSP	14.5	kHz
Level adjust I <sup>2</sup> S1 and I <sup>2</sup> S2 inputs	yes	control range	-15 to +15	dB
		resolution	1	dB
Level adjust I <sup>2</sup> S1 and I <sup>2</sup> S2 outputs	yes	control range	-15 to +15	dB
		resolution	1	dB
		mute position at step	00010000	
Level adjust analog crossbar path	no	control positions	0, 3, 6 and 9	dB

Digital TV Sound Processor (DTVSP)

TDA9870A

FUNCTION	EXPERT MODE	PARAMETER	VALUE	UNIT
Level adjust audio ADC outputs	yes	control range	+15 to -15	dB
		resolution	1	dB
Level adjust FM path	yes	control range	+15 to -15	dB
		resolution	1	dB

6.3 Description of the analog audio section

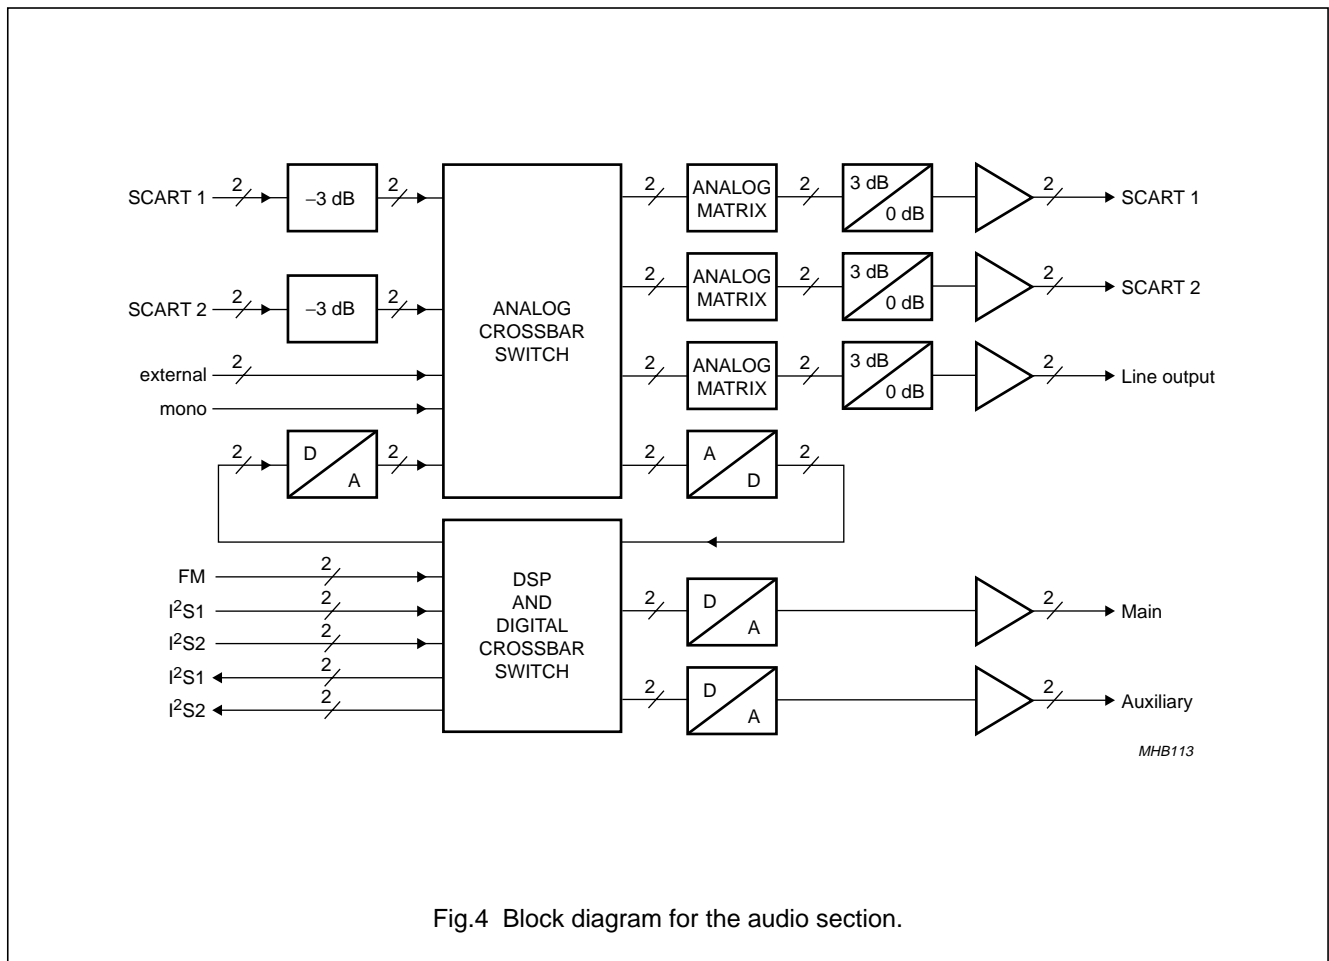

Fig.4 Block diagram for the audio section.

# Digital TV Sound Processor (DTVSP)

# TDA9870A

### 6.3.1 ANALOG CROSSBAR SWITCH AND ANALOG MATRIX (see also Fig.6)

There are a number of analog input and output ports with the TDA9870A. Analog source selector switches are employed to provide the desired analog signal routing capability. The analog signal routing is performed by the analog crossbar switch section. A dual audio ADC provides the connection to the DSP section and a dual audio DAC provides the connection from the DSP section to the analog crossbar switch. The digital signal routing is performed by a digital crossbar switch.

The basic signal routing philosophy of the TDA9870A is that each switch handles two signal channels at the same time, e.g. left and right, language A and B, directly at the source.

Each source selector switch is followed by an analog matrix to perform further selection tasks, such as putting a signal from one input channel, say language A, to both output channels or for swapping left and right channels. The analog matrix provides the functions given in Table 5 (see also Fig.5).

**Table 5** Analog matrix functions

MODE	MATRIX OUTPUT	
	LEFT OUTPUT	RIGHT OUTPUT
1	left input	right input
2	right input	left input
3	left input	left input
4	right input	right input

All switches and matrices are controlled via the I<sup>2</sup>C-bus.

### 6.3.2 SCART INPUTS

The SCART specification allows for a signal level of up to 2 V (RMS). Because of signal handling limitations, due to the 5 V supply voltage of the TDA9870A, it is necessary to have fixed 3 dB attenuators at the SCART inputs to obtain a 2 V input. This results in a -3 dB SCART-to-SCART copy gain. If 0 dB copy gain is preferred (with maximum 1.4 V input), there are 3 dB and 0 dB amplifiers at the outputs of SCART 1 and SCART 2 and at the line output.

The input attenuator is realized by an external series resistor in combination with the input impedance, both of which form a voltage divider. With this voltage divider the maximum SCART signal level of 2 V (RMS) is scaled down to 1.4 V (RMS) at the input pin.

### 6.3.3 EXTERNAL AND MONO INPUTS

The 3 dB input attenuators are not required for the external and mono inputs, because those signal levels are under control of the TV designer. The maximum allowed input level is 1.4 V (RMS). By adding external series resistors, the external inputs can be used as an additional SCART input.

### 6.3.4 SCART OUTPUTS

The SCART outputs employ amplifiers with two gain settings. The gain can be set to 3 dB or to 0 dB via the I<sup>2</sup>C-bus. The 3 dB position is needed to compensate for the 3 dB attenuation at the SCART inputs should SCART-to-SCART copies with 0 dB gain be preferred [under the condition of 1.4 V (RMS) maximum input level]. The 0 dB position is needed, for example, for an external-to-SCART copy with 0 dB gain.

---

## Digital TV Sound Processor (DTVSP)

## TDA9870A

---

### 6.3.5 LINE OUTPUT

The line output can provide an unprocessed copy of the audio signal in the loudspeaker channels. This can be either an external signal that comes from the dual audio ADC, or a signal from an internal digital audio source that comes from the dual audio DAC. The line output employs amplifiers with two gain settings. The 3 dB position is needed to compensate for the attenuation at the SCART inputs, while the 0 dB position is needed, for example, for non-attenuated external or internal digital signals (see Section 6.3.4).

### 6.3.6 LOUDSPEAKER (MAIN) AND HEADPHONE (AUXILIARY) OUTPUTS

Signals from any audio source can be applied to the loudspeaker and to the headphone output channels via the digital crossbar switch and the DSP.

### 6.3.7 DUAL AUDIO DAC

The TDA9870A contains three dual audio DACs, one for the connection from the DSP to the analog crossbar switch section and two for the loudspeaker and headphone outputs. Each of the three dual low-noise high-dynamic range DACs consists of two 15-bit DACs with current outputs, followed by a buffer operational amplifier. The audio DACs operate with four-fold oversampling and noise shaping.

### 6.3.8 DUAL AUDIO ADC

There is one dual audio ADC in the TDA9870A for the connection of the analog crossbar switch section to the DSP. The dual audio ADC consists of two bitstream 3rd-order sigma-delta audio ADCs and a high-order decimation filter.

### 6.3.9 STANDBY MODE

The standby mode (subaddress 1, bit 5) disables most functions and reduces power dissipation. The analog crossbar switch and the SCART section remains operational and can be controlled by the I<sup>2</sup>C-bus to support copying of analog signals from SCART-to-SCART.

Unused internal registers may lose their information in standby mode. Therefore, the device needs to be initialized on returning to normal operation. This can be accomplished in the same way as after a power-on reset.

### 6.3.10 SUPPLY GROUND

The different supply grounds  $V_{SSX}$  are internally connected via substrate. It is therefore recommended to connect all ground pins externally close to the pins by a copper plane.

**Notes**

- All analog and digital supply ground pins are connected internally.
- Set demodulator to AM mode. Apply an AM carrier (with 1 kHz and 100%) to one channel. Check AGC step. Switch AGC off and set AGC to the gain step found. Measure the 1 kHz signal level of this channel and take it as a reference. Switch to the other SIF input to which no signal is connected and which is terminated with 50  $\Omega$ . Measure now the 1 kHz crosstalk signal level. The SIF source resistance should be low (50  $\Omega$ ).
- Definitions of levels and level setting:  
The full-scale level for analog audio signals is  $V_{FS} = 1.4 \text{ V (RMS)}$ . The nominal level at the digital crossbar switch is defined at –15 dB (full-scale). Nominal audio input levels:  
external, mono: 500 mV (RMS); –9 dB (full-scale).  
See also Tables 6 and 7.
- FM source; in dual mode only A (respectively B) signal modulated; measured at B (respectively A) channel output;  $V_o = 1 \text{ V (RMS)}$  of modulated channel.
- FM source; in stereo mode only L (respectively R) signal modulated; measured at R (respectively L) channel output;  $V_o = 1 \text{ V (RMS)}$  of modulated channel. The stereo channel separation may be limited by adjustment tolerances of the transmitter.
- If the supply voltage for the TDA9870A is switched off, because of the ESD protection circuitry, all audio input pins are short-circuited. To avoid a short-circuit at the SCART inputs a 15 k $\Omega$  resistor (–3 dB divider) has to be used.
- The SCART specification allows a signal level of up to 2 V (RMS). Because of signal handling limitations due to the 5 V supply voltage for the TDA9870A, there is a need for fixed 3 dB attenuators at the SCART inputs. To achieve SCART-to-SCART copies with 0 dB gain, there are 3 dB and 0 dB amplifiers at the outputs of SCART 1 and SCART 2 and at the line output. The attenuator is realized by an internal resistor that works together with an external series resistor as a voltage divider. With this voltage divider the maximum SCART input signal level of 2 V (RMS) is scaled down to 1.4 V (RMS) at the input pin. To avoid clipping, the 3 dB gain must not be used if the SCART input signal is larger than 1.4 V (RMS).
- ADC level adjust = 6 dB, all other level adjusts = 0 dB, if external –3 dB divider is used set output buffer gain to 3 dB, tone control to 0 dB, AVL off and volume control to 0 dB.

## Digital TV Sound Processor (DTVSP)

TDA9870A

**Table 6** FM level setting

0 dB (full-scale) = 1.4 V (RMS); note 1.

2 CHANNEL FM STANDARD	TRANSMITTER NOMINAL MODULATION DEPTH	NOMINAL LEVEL AT DEMODULATOR OUTPUT (FULL-SCALE)	CARRIER #1 FREQUENCY	CARRIER #2		DE-EMPHASIS OF CARRIER #1 AND CARRIER #2	FM LEVEL ADJUST SETTING OF CARRIER #1 AND CARRIER #2

SAT FM, mono	85 kHz deviation	-9 dB	0 dB				

## Digital TV Sound Processor (DTVSP)

## TDA9870A

**10 I<sup>2</sup>C-BUS CONTROL****10.1 Introduction**

The TDA9870A is fully controlled via the I<sup>2</sup>C-bus. Control is exercised by writing data to one or more internal registers. Status information can be read from an array of registers to enable the controlling microcontroller to determine whether any action is required.

The device has an I<sup>2</sup>C-bus slave transceiver, in accordance with the fast-mode specification, with a maximum speed of 400 kbits/s. Information concerning the I<sup>2</sup>C-bus can be found in brochure "*I<sup>2</sup>C-bus and how to use it*" (order number 9398 393 40011). To avoid conflicts in a real application with other ICs providing similar or complementary functions, there are four possible slave addresses available which can be selected by pins ADDR1 and ADDR2 (see Table 8).

**Table 8** Possible slave addresses

ADDR2	ADDR1	SLAVE ADDRESS A6 TO A0
0	0	1 0 1 1 0 0 0
0	1	1 0 1 1 0 0 1
1	0	1 0 1 1 0 1 0
1	1	1 0 1 1 0 1 1

The I<sup>2</sup>C-bus interface remains operational in the standby mode of the TDA9870A to allow control of the analog source selectors with regard to SCART-to-SCART copying.

The device will not respond to a 'general call' on the I<sup>2</sup>C-bus, i.e. when a slave address of 0000000 is sent by a master.

The data transmission between the microcontroller and the other I<sup>2</sup>C-bus controlled ICs is not disturbed when the supply voltage of the TDA9870A is not connected.

**10.2 Power-up state**

At power-up the device is in the following state:

- All outputs muted
- No sound carrier frequency loaded
- General purpose I/O pins ready for input (HIGH)
- Input SIF1 selected with:
  - AGC on
  - Small hysteresis
  - SIF input level shift 0 dB.
- Demodulators for both sound carriers set to FM with:
  - Identification for B/G, D/K, response time 1 s
  - Level adjust set to 0 dB
  - De-emphasis 50 µs
  - Matrix set to mono.
- Main channel set to FM input with:
  - Spatial off
  - Pseudo off
  - AVL off
  - Volume mute
  - Bass flat
  - Treble flat
  - Contour off
  - Bass boost flat.
- Auxiliary channel set to FM input with:
  - Volume mute
  - Bass flat
  - Treble flat.
- Feature interface all outputs off
- Beeper off
- Monitoring of carrier 1 FM demodulator DC output.

After power-up a device initialization has to be performed via the I<sup>2</sup>C-bus to put the TDA9870A into the proper mode of operation, in accordance with the desired TV standard, audio control settings, etc.

## Digital TV Sound Processor (DTVSP)

## TDA9870A

**10.3 Slave receiver mode**

As a slave receiver, the TDA9870A provides 46 registers for storing commands and data. These registers are accessed via so-called subaddresses. A subaddress can be thought of as a pointer to an internal memory location.

**Table 9** I<sup>2</sup>C-bus; slave address, subaddress and data format

S	SLAVE ADDRESS	0	ACK	SUBADDRESS	ACK	DATA	ACK	P
---	---------------	---	-----	------------	-----	------	-----	---

**Table 10** Explanation of Table 9

BIT	FUNCTION
S	START condition
SLAVE ADDRESS	7-bit device address
0	data direction bit (write to device)
ACK	acknowledge by slave
SUBADDRESS	address of register to write to
DATA	data byte to be written into register
P	STOP condition

It is allowed to send more than one data byte per transmission to the TDA9870A. In this event, the subaddress is automatically incremented after each data byte, resulting in storing the sequence of data bytes at successive register locations, starting at SUBADDRESS. A transmission can start at any valid subaddress. Each byte is acknowledged with ACK (acknowledge).

There is no 'wrap-around' of subaddresses.

Commands and data are processed as soon as they have been completely received. Functions requiring more than one byte will, thus, be executed only after all bytes for that function have been received. If the transmission is terminated (STOP condition) before all bytes have been received, the incomplete data for that function is ignored.

**Table 11** Format for a transmission employing auto-increment of subaddresses

S	SLAVE ADDRESS	0	ACK	SUBADDRESS	ACK	DATA BYTE A <sup>(1)</sup>	DATA	ACK	P
---	---------------	---	-----	------------	-----	----------------------------	------	-----	---

**Note**

1. n data bytes with auto-increment of subaddresses.

Data patterns sent to the various subaddresses are not checked for being illegal or not at that address, except for the functions of volume, bass, treble control, bass boost and level adjust.

Detection of a STOP condition without a preceding acknowledge bit is regarded as a bus error. The last operation will not then be executed.

## Digital TV Sound Processor (DTVSP)

**Note**

1. These bits have not been assigned to a function.

The following sub-sections provide a detailed description of the slave receiver registers:

### 10.3.1 AGC GAIN REGISTER

#### 10.3.1.1 Description

If the automatic gain control function is switched off in the general configuration register, the contents of this register will define a fixed gain of the AGC stage. The input voltages given are meant to generate a full scale output from the SIF ADC. If automatic gain control is on, the AGCGAIN setting is ignored. After switching off the automatic gain control function, the latest gain control setting is copied to the AGC gain register. If the AGC input level shift bit AGCLEV is set to HIGH the input signal is scaled with –10 dB. The AGCLEV bit is also active if the automatic gain function is enabled.

It should be noted that the input voltages should be considered as approximate target values.

**Table 13** Description of the AGC gain register

BIT	NAME	DESCRIPTION
7 (MSB)	–	set to logic 0
6	–	set to logic 0
5	AGCLEV	If the AGC input level shift bit AGCLEV is set to HIGH the input signal is scaled with –10 dB. The AGCLEV bit is also active if the automatic gain function is enabled.
4	AGCGAIN	If the automatic gain control function is switched off in the general configuration register, the contents of this register will define a fixed gain of the AGC stage.

## Digital TV Sound Processor (DTVSP)

## TDA9870A

## 10.3.2 GENERAL CONFIGURATION REGISTER

## 10.3.2.1 Description

Table 15 Description of Table 16

NAME	HIGH/LOW	FUNCTION
SIFSEL	HIGH	Selects pin SIF2 for input (recommended for satellite tuner).
	LOW	Pin SIF1 (terrestrial TV) is selected.
AGCOFF	HIGH	Forces the AGC block to a fixed gain as defined in the AGC gain register.
	LOW	The automatic gain control function is enabled and the contents of the AGC gain register is ignored.
AGCSLOW	HIGH	A longer decay time is selected for input signals with strong video modulation (intercarrier). This bit only has an effect when bit AGCOFF = 0.
	LOW	Selects normal attack and decay times for the AGC.
CLRPOR	HIGH	Resets the power fail detector to LOW.
	LOW	This bit is automatically reset to LOW after bit POR in the device status register has been reset.
INIT	HIGH	Causes initialization of TDA9870A to its default settings. This has the same effect as a power-on reset. If there is a conflict between the default settings and any bit set HIGH in this register, the bits of this register have priority over the corresponding default setting.
	LOW	This bit is automatically reset to LOW after initialization. When set LOW, the TDA9870A is in its normal mode of operation.
STDBY	HIGH	Puts the TDA9870A into the standby mode. Most functions are disabled and power dissipation is somewhat reduced, but the analog selectors/matrices remain operational to support analog copying from SCART-to-SCART and vice versa.
	LOW	The TDA9870A is in its normal mode of operation. On return from standby mode, the device is in its power-on reset mode and needs to be re-initialized.
P1OUT, P2OUT	–	These bits control the general purpose input/output pins. The contents of these bits is written directly to the corresponding pins. If input is desired, the bits must be set HIGH to allow the pins to be pulled LOW externally. Input from the pins is reflected in the device status register (see Section 10.4, subaddress 0). P1OUT is recommended to be used for switching an SIF trap for the adjacent picture carrier in designs that employ such a trap.

## 10.3.2.2 Definition

Table 16 Subaddress 1 (note 1)

BIT	NAME	DESCRIPTION
7 (MSB)	P2OUT	general purpose I/O pin 2
6	P1OUT	general purpose I/O pin 1
5	STDBY	standby mode on/off
4	INIT	initialize to defaults (as reset)
3	CLRPOR	clear power-on reset flip-flop
2	AGCSLOW	AGC decay time
1	AGCOFF	AGC on/off
0 (LSB)	SIFSEL	SIF input select

## Note

1. The default setting at power-up is 11000000.

# Digital TV Sound Processor (DTVSP)

# TDA9870A

## 10.3.3 MONITOR SELECT REGISTER

### 10.3.3.1 Description

This register is used to define the signal source, the level of which is to be monitored, and if the peak level is to be monitored. Peak level refers to the magnitude of the maximum excursion of a signal. Data can be read-out in the I<sup>2</sup>C-bus slave transmitter mode (see Section 10.4, subaddresses 5 and 6).

Audio magnitude/phase is related to the FM demodulator output. Phase information is provided, when it operates in FM mode, while magnitude is supplied in AM mode.

**Table 17** Description of bit PEAKMON

NAME	HIGH/LOW	FUNCTION
PEAKMON	HIGH	selects the peak level of a source to be monitored
	LOW	the last sample will be supplied

### 10.3.3.2 Definition

**Table 18** Subaddress 2 (note 1)

MSB						LSB	
B7	B6	B5	B4	B3	B2	B1	B0
PEAKMON	0	0	see Table 20		see Table 19		

**Note**

- The default setting at power-up is 00000000.

**Table 19** Signal source (note 1)

B2	B1	B0	SIGNAL SOURCE
0	0	0	DC output of FM demodulator
0	0	1	audio magnitude/phase, FM demodulator output
0	1	0	crossbar input from FM/AM channel
0	1	1	don't care
1	0	0	crossbar input from I <sup>2</sup> S1 channel
1	0	1	crossbar input from I <sup>2</sup> S2 channel
1	1	0	crossbar input from audio ADC channel
1	1	1	input to Main channel DAC (without beeper)

**Note**

- The term 'crossbar' refers to the digital selector, where level-adjusted signals from various sources are available.

Digital TV Sound Processor (DTVSP)

TDA9870A

**Table 20** Monitor output

B4	B3	MONITOR OUTPUT
0	0	$\frac{L \text{ input} + R \text{ input}}{2}$
0	1	L input (channel 1, respectively)
1	0	R input (channel 2, respectively)

10.3.3.3 Note

By reading out level read-out registers (subaddresses 5 and 6, see Section 10.4), the current peak level will be reset.

10.3.4 CARRIER 1 FREQUENCY REGISTER

10.3.4.1 Description

The three bytes together constitute a 24-bit frequency control word to represent the sound carrier (i.e. mixer) frequency in accordance with the following formula:

$$\text{data} = \frac{f_{\text{mix}}}{f_{\text{clk}}} \times 2^{24}$$

Where:

- data = 24-bit frequency control word.
- $f_{\text{mix}}$  = desired sound carrier frequency.
- $f_{\text{clk}}$  = 12.288 MHz (clock frequency of mixer).
- $2^{24}$  = 16777216 (number of steps in a 24-bit word size).

Example: A 5.5 MHz sound carrier frequency will be generated by sending the following sequence of data bytes to the TDA9870A (data = 7509333 in decimal notation or 729555 in HEX): 01110010 10010101 01010101.

As three bytes are required to define a carrier frequency, execution of this command starts only after all bytes have been received. If an error occurs, e.g. a premature STOP condition, partial data for this function is ignored.

The default setting at power-up is 00000000 for all three bytes.

10.3.4.2 Definition

Most significant part at subaddress 3.

10.3.5 CARRIER 2 FREQUENCY REGISTER

10.3.5.1 Description

Same as for sound carrier 1.

If the carrier 2 frequency register is used, it will be for the second FM sound carrier of a terrestrial or satellite FM program.

## Digital TV Sound Processor (DTVSP)

TDA9870A

## 10.3.5.2 Definition

Subaddresses 6 to 8.

Same as for sound carrier 1, except for subaddresses used.

## 10.3.6 DEMODULATOR CONFIGURATION REGISTER

## 10.3.6.1 Description

**Table 22** Description of subaddress 9 (notes 1 and 2)

NAME	HIGH/LOW	FUNCTION
CH1MODE	HIGH	selects the hardware for the first sound carrier to operate in AM mode
	LOW	FM mode is assumed. This applies to both terrestrial and satellite FM reception.
FILTBW0, FILTBW1	–	selects the filter bandwidth for channel 1 and channel 2 in accordance with Table 25
CH2MOD0, CH2MOD1	–	These bits control the hardware for the second sound carrier in accordance with the truth Table 24.
IDAREA	HIGH	selects FM identification frequencies in accordance with the specification for Korea
	LOW	frequencies for Europe are selected (B/G and D/K standard)
IDMOD0, IDMOD1	–	These bits define the response time after which a sound mode identification result may be expected. The longer the time, the more reliable the identification.

**Notes**

1. It is recommended to switch the FM sound mode identification off whenever the received program is not a terrestrial 2-carrier sound.
2. Switching the identification off will reset the associated hardware to a defined state.

## 10.3.6.2 Definition

**Table 23** Subaddress 9 (note 1; see Table 22)

BIT	NAME	DESCRIPTION
7 (MSB)	IDMOD1	response time for FM sound mode identification
6	IDMOD0	
5	IDAREA	application area for FM identification
4	FILTBW1	selects filter bandwidth in accordance with Table 25
3	CH2MOD1	channel 2 receive mode
2	CH2MOD0	
1	FILTBW0	selects filter bandwidth in accordance with Table 25
0 (LSB)	CH1MODE	channel 1 receive mode

**Note**

1. The default setting at power-up is 00000000.

## Digital TV Sound Processor (DTVSP)

TDA9870A

**Table 24** Channel 2 receive mode (see Table 23)

B3	B2	CHANNEL 2
0	0	FM
0	1	AM
1	0	don't care

**Table 25** Filter bandwidth Channel 1 and Channel 2 (see Table 23)

B4	B1	FILTER BANDWIDTH		FILTER MODES
		CH1	CH2	
0	0	narrow	narrow	recommended for nominal terrestrial broadcast conditions and SAT with 2 carriers
0	1	extra wide	narrow	recommended only for high-deviation SAT mono carriers (e.g. obsolete main channel on Astra)
1	0	medium	medium	recommended for moderately overmodulated broadcast conditions
1	1	wide	wide	recommended for strongly overmodulated broadcast conditions

**Table 26** Identification mode (see Table 23)

B7	B6	IDENT MODE
0	0	slow
0	1	medium
1	0	fast
1	1	off/reset

## 10.3.7 FM DE-EMPHASIS REGISTER

## 10.3.7.1 Description

This register is used to select the proper de-emphasis characteristics as appropriate for the standard of the received carrier. Bits B3 to B0 apply to sound carrier 1, bits B7 to B4 apply to sound carrier 2. In the event of A2 reception, both groups must be set to the same characteristics.

## 10.3.7.2 Definition

**Table 27** Subaddress 10 (note 1)

BIT	NAME	DESCRIPTION
7 (MSB)	ADEEM2	adaptive de-emphasis on/off
6		time constant selection for FM de-emphasis
5		
4		
3	ADEEM1	adaptive de-emphasis on/off
2		time constant selection for FM de-emphasis
1

**Note**

1. The default setting at power-up is 00000000.

## Digital TV Sound Processor (DTVSP)

TDA9870A

**Table 28** De-emphasis

B6, B2	B5, B1	B4, B0	DE-EMPHASIS
0	0	0	50 $\mu$ s (Europe)
0	0	1	60 $\mu$ s
0	1	0	75 $\mu$ s (M standard)
0	1	1	J17
1	0	0	off

**Table 29** Description of bits ADEEM1 and ADEEM2 (note 1)

NAME	HIGH/LOW	FUNCTION
ADEEM1, ADEEM2	HIGH	Activates the adaptive de-emphasis function, which is required for certain satellite FM channels. The standard FM de-emphasis must then be set to 75 $\mu$ s.
	LOW	the adaptive de-emphasis is off

**Note**

- The FM de-emphasis gain is 0 dB at 40 Hz.

## 10.3.8 FM MATRIX REGISTER

## 10.3.8.1 Description

This register is used to select the proper dematrixing characteristics as appropriate for the standard of the received carrier and the related sound mode identification.

## 10.3.8.2 Definition

**Table 30** Subaddress 11 (notes 1)

MSB							LSB
B7	B6	B5	B4	B3	B2	B1	B0
0	0	0	0	0	see Table 31		

**Note**

- The default setting at power-up is 00000000.

## Digital TV Sound Processor (DTVSP)

## 10.3.10 FM CHANNEL 2 LEVEL ADJUST REGISTER

## 10.3.10.1 Description

This register is used to correct for standard and station-dependent differences of signal levels. Table 33 applies to sound carrier 2 in its FM and AM modes. In the event of A2, channels 1 and 2 should be adjusted to the same level.

## Digital TV Sound Processor (DTVSP)

## TDA9870A

## 10.3.10.2 Definition

## Note

1. The default setting at power-up is 00000000.

# Digital TV Sound Processor (DTVSP)

# TDA9870A

### 10.3.11 REGISTER 14

#### 10.3.11.1 Description

Set to logic 0. This bits have not been assigned to a function.

### 10.3.12 REGISTER 15

#### 10.3.12.1 Description

Set to logic 0. This bits have not been assigned to a function.

### 10.3.13 REGISTER 16

#### 10.3.13.1 Description

Set to logic 0. This bits have not been assigned to a function.

### 10.3.14 REGISTER 17

#### 10.3.14.1 Description

Set to logic 0. This bits have not been assigned to a function.

### 10.3.15 AUDIO MUTE CONTROL REGISTER

#### 10.3.15.1 Description

When any of these bits are set HIGH, the corresponding pair of output channels will be muted. A LOW bit allows normal signal output.

There is a soft-mute facility for the Main and Auxiliary output channels to provide click-free muting independent of the volume control. This is switched on/off by bits MUTMAIN and MUTAUX.

#### 10.3.15.2 Definition

**Table 34** Subaddress 18 (note 1)

BIT	NAME	DESCRIPTION
7 (MSB)	MUTI <sup>2</sup> S2	mute I <sup>2</sup> S2 outputs
6	MUTI <sup>2</sup> S1	mute I <sup>2</sup> S1 outputs
5	MUTDAC	mute internal DAC
4	MUTLINE	mute line outputs
3	MUTSC2	mute SCART 2 outputs
2	MUTSC1	mute SCART 1 outputs
1	MUTAUX	mute Auxiliary outputs
0 (LSB)	MUTMAIN	mute Main channels

**Note**

- The default setting at power-up is 11111111.

### 10.3.16 DAC OUTPUT SELECT REGISTER

#### 10.3.16.1 Description

This register is used to define both the signal source to be entered into the DAC and the mode of the digital matrix for signal selection. The DAC is used for signal output from digital sources at analog outputs.

The bits DACGAIN1 and DACGAIN2 can introduce some extra gain at the input to the DAC. DACGAIN1 adds 3 dB and DACGAIN2 adds 6 dB of gain, respectively.

# Digital TV Sound Processor (DTVSP)

# TDA9870A

### 10.3.16.2 Definition

**Table 35** Subaddress 19 (note 1)

MSB					LSB		
B7	B6	B5	B4	B3	B2	B1	B0
DACGAIN2 <sup>(2)</sup>	see Table 37			DACGAIN1 <sup>(2)</sup>	see Table 36		

**Notes**

## Digital TV Sound Processor (DTVSP)

## TDA9870A

## 10.3.17 SCART 1 OUTPUT SELECT REGISTER

## 10.3.17.1 Description

This register is used to define both the signal source to be output at SCART 1 and the output channel selector mode.

## 10.3.17.2 Definition

**Table 39** Subaddress 20 (note 1)

MSB					LSB		
B7	B6	B5	B4	B3	B2	B1	B0
0	SC1GAIN <sup>(2)</sup>	see Table 41		0	see Table 40		

**Notes**

1. The default setting at power-up is 00000001.
2. See Table 42.

**Table 40** Signal source

B2	B1	B0	SIGNAL SOURCE
0	0	0	SCART 1 input
0	0	1	SCART 2 input
0	1	0	external input
0	1	1	mono input
1	0	0	DAC input

**Table 41** Bits B5 and B4

B5	B4	L OUTPUT	R OUTPUT
0	0	L input	R input
0	1	L input	L input
1	0	R input	R input
1	1	R input	L input

**Table 42** Description of bit SC1GAIN

NAME	HIGH/LOW	FUNCTION
SC1GAIN	HIGH	Activates the 3 dB gain stage at the SCART 1 output buffers. As any SCART input passes a 3 dB attenuator, this gain stage can be used to compensate that attenuation, resulting in a 0 dB insertion loss when copying from SCART 2 input to SCART 1 output. However, that gain must be used with great care, as it will cause signal clipping at high input levels.
	LOW	The audio signal will be output unchanged (0 dB gain).

## Digital TV Sound Processor (DTVSP)

## TDA9870A

## 10.3.18 SCART 2 OUTPUT SELECT REGISTER

## 10.3.18.1 Description

This register is used to define both the signal source to be output at SCART 2 and the output channel selector mode.

## 10.3.18.2 Definition

**Table 43** Subaddress 21 (note 1)

MSB					LSB		
B7	B6	B5	B4	B3	B2	B1	B0
0	SC2GAIN <sup>(2)</sup>	see Table 45		0	see Table 44		

**Notes**

1. The default setting at power-up is 00000000.
2. See Table 46.

**Table 44** Signal source

B2	B1	B0	SIGNAL SOURCE
0	0	0	SCART 1 input
0	0	1	SCART 2 input
0	1	0	external input
0	1	1	mono input
1	0	0	DAC input

B5	B4	L OUTPUT	R OUTPUT
0	0	L input	R input
0	1	L input	L input
1	0	R input	R input
1	1	R input	L input

**Table 46** Description of bit SC2GAIN

NAME	HIGH/LOW	FUNCTION
SC2GAIN	HIGH	Activates the 3 dB gain stage at the SCART 2 output buffers. As any SCART input passes a 3 dB attenuator, this gain stage can be used to compensate that attenuation, resulting in a 0 dB insertion loss when copying from SCART 1 input to SCART 2 output. However, that gain must be used with great care, as it will cause signal clipping at high input levels.
	LOW	The audio signal will be output unchanged (0 dB gain).

## Digital TV Sound Processor (DTVSP)

## TDA9870A

## 10.3.19 LINE OUTPUT SELECT REGISTER

## 10.3.19.1 Description

By definition, the line output conveys the same signal as the Main (loudspeaker) channel, but in a non-processed form. This register is used to characterize the signal to be output at the line output and define the output channel selector mode.

## 10.3.19.2 Definition

**Table 47** Subaddress 22 (note 1)

BIT	NAME	DESCRIPTION
7 (MSB)	–	set to logic 0
6	LINGAIN	line output gain on/off; see Table 49
5		see Table 48
4		
3	–	set to logic 0
2	–	set to logic 0
1	–	set to logic 0
0 (LSB)	LINSEL	select source for line output; see Table 49

**Note**

1. The default setting at power-up is 00000000.

**Table 48** Bits B5 and B4

B5	B4	L OUTPUT	R OUTPUT
0	0	L input	R input
0	1	L input	L input
1	0	R input	R input
1	1	R input	L input

**Table 49** Description of bits LINSEL and LINGAIN

NAME	HIGH/LOW	FUNCTION
LINSEL	HIGH	Specifies that a signal from an analog source is being processed in the Main channel. Analog signal sources comprise SCART 1 input, SCART 2 input, external input and mono input, i.e. any input to the ADC.
	LOW	Specifies that a signal from a digital source is being processed in the Main channel. Digital signal sources comprise FM, I <sup>2</sup> S1 input and I <sup>2</sup> S2 input.
LINGAIN	HIGH	Activates the 3 dB gain stage at the line output buffers.
	LOW	The audio signal will be output unchanged (0 dB gain).

## Digital TV Sound Processor (DTVSP)

TDA9870A

## 10.3.20 ADC OUTPUT SELECT REGISTER

## 10.3.20.1 Description

This register is used to define the signal source for the ADC. There is no output channel selector, because all digital signal sinks of the ADC have their own matrix. Instead, a level adjustment facility for the ADC output is provided.

## 10.3.20.2 Definition

**Table 50** Subaddress 23 (note 1)

MSB						LSB	
B7	B6	B5	B4	B3	B2	B1	B0
see Table 51			see Table 52				

**Note**

1. The default setting at power-up is 00000000.

**Table 51** Signal source

B7	B6	B5	SIGNAL SOURCE
0	0	0	SCART 1 input
0	0	1	SCART 2 input

## Digital TV Sound Processor (DTVSP)

TDA9870A

**Table 60** Description of Table 56 (notes 1, 2 and 3)

NAME	FUNCTION
AVL0, AVL1	these bits set the mode of operation of the automatic volume level control function at the entrance to the Main (loudspeaker) channel
PSEUDO0, PSEUDO1	These bits set the amount of the effect function (pseudo stereo) for mono signals in the Main channel. This function should be activated only in accordance with the result of the sound mode identification.
SPATIAL0, SPATIAL1	These bits set the amount of the effect function (stereo base width expansion) for stereo signals in the Main channel. This function should be activated only in accordance with the result of the sound mode identification.

**Notes**

- Switching the AVL off will reset the associated hardware to a defined state.
- When the signal source for the Main channel is changed while the AVL is on, the AVL needs to be reset in order to avoid excessive settling times. This can be achieved by switching the AVL off and on again.
- The pseudo stereo function is based on an all-pass filter. A 90 degrees phase shift occurs at the frequencies stated in Table 58. There is a gain of 3 dB in the left audio channel.

## 10.3.23 VOLUME CONTROL REGISTERS (MAIN)

## 10.3.23.1 Description

These two registers control the volume setting of the Main (loudspeaker) channel. The register at subaddress 26 applies to the left channel signal, while the register at subaddress 27 applies to the right channel signal.

Balance control is exercised by offsetting the left and right channel volume settings.

## 10.3.24 CONTOUR CONTROL REGISTER

## 10.3.24.1 Description

This register is used to apply the contour or loudness function (physiological volume control) to the left and right signal channels of the Main channel by means of an extra bass boost. The gain setting must be chosen in accordance with the volume control setting for the Main channel. For example, the contour gain could be incremented for every 5 dB, or so, of decrease of the volume setting. This needs to be done by the microcontroller. The 0 dB contour setting is equal to contour off.

## 10.3.28 VOLUME CONTROL REGISTERS (AUXILIARY)

## 10.3.28.1 Description

These two registers control the volume setting of the Auxiliary (headphone) channel. The register at subaddress 32 applies to the left channel signal, while the register at subaddress 33 applies to the right channel signal.

Balance control is exercised by offsetting the left and right channel volume settings.

**Note**

1. With 16.384 MHz, the duty cycle is 33% : 67%.

**Table 73** Description of Table 71

NAME	HIGH/LOW	FUNCTION
I <sup>2</sup> SOUT	HIGH	Enables the output of serial audio data (2 pins) plus serial bit clock and word select in a format determined by the I <sup>2</sup> SFORM bit. The TDA9870A is then an I <sup>2</sup> S-bus master.
	LOW	the outputs mentioned will be 3-stated, thereby improving the EMC performance
I <sup>2</sup> SFORM	HIGH	an MSB-aligned, MSB-first output format is selected, i.e. a level change at the word select pin indicates the beginning of a new audio sample
	LOW	the standard I <sup>2</sup> S-bus output format is selected
SYSOUT	HIGH	enables the output of a system (or master) clock signal at pin SYSCLK
	LOW	the output will be off, thereby improving the EMC performance

## 10.3.38 BEEPER FREQUENCY CONTROL REGISTER

## 10.3.38.1 Description

This register is used to select from sample beeper oscillator frequencies. The beeper output signal is added to the Main and Auxiliary channel output DAC.

Due to the frequency response of the audio DACs upsampling filters, the 25 kHz beep is approximately 5 dB louder than the 390 Hz beep.

## 10.3.38.2 Definition

Table 84 Subaddress 43 (note 1)

MSB							LSB		GENERATED FREQUENCY (Hz)
B7	B6	B5	B4	B3	B2	B1	B0

0	0	0	0	0	0	0	0	390	

## Note

1. The default setting at power-up is 00000000.

## 10.3.39 BEEPER VOLUME CONTROL REGISTER

## 10.3.39.1 Description

This register is used to set the beeper volume. The gain setting is relative to digital full scale at the input to the Main and Auxiliary channel output DACs. The beeper volume is independent of any other volume setting.

The beeper signal is added to the Main and Auxiliary channel output signals in the  $2 \times f_s$  domain. The beeper volume should be set with great care, when the audio signals in the Main and Auxiliary channels are close to digital full-scale, to avoid output signal distortion due to overload.

Digital TV Sound Processor (DTVSP)

TDA9870A

10.3.40 BASS BOOST CONTROL REGISTER

10.3.40.1 Description

This register is used to select from a few sample bass boost settings to modify the frequency characteristics of the Main channel (shelving filter). Bits B3 to B0 apply to the left channel, bits B7 to B4 apply to the right channel. This function must be used with care in order to avoid clipping distortion at high volume settings.

More sophisticated control of the bass boost filter can be exercised in the expert mode (see Section 10.5). The user then has full control over this 2nd-order filter and can, within limits, realize bass equalizers with arbitrary centre frequencies, Q factors and boost/cut settings.

10.3.40.2 Definition

**Table 86** Subaddress 45 (note 1; see Table 87)

MSB				LSB			
B7	B6	B5	B4	B3	B2	B1	B0

## Digital TV Sound Processor (DTVSP)

## TDA9870A

**10.4 Slave transmitter mode**

As a slave transmitter, the TDA9870A provides 13 registers with status information and data, a part of which is for Philips internal purposes only. These registers can be accessed by means of subaddresses.

**Table 88** General format for reading data from the TDA9870A

S	SLAVE ADDRESS	0	ACK	SUBADDRESS	ACK	Sr	SLAVE ADDRESS	1	ACK	DATA	NAm	P
---	---------------	---	-----	------------	-----	----	---------------	---	-----	------	-----	---

**Table 89** Explanation of Tables 88 and 90

BIT	FUNCTION
S	START condition
SLAVE ADDRESS	7-bit device address
0	data direction bit (write to device)
ACK	acknowledge (by the slave)
SUBADDRESS	address of register to read from
Sr	repeated START condition
1	data direction bit (read from device)
DATA	data byte read from register
NAm	not acknowledge (by the master)
Am	acknowledge (by the master)
P	STOP condition

Reading of data can start at any valid subaddress. It is allowed to read more than 1 data byte per transmission from the TDA9870A. In this situation, the subaddress is automatically incremented after each data byte, which results in reading the sequence of data bytes from successive register locations, starting at SUBADDRESS.

**Table 90** Format of a transmission using automatic incrementing of subaddresses

S	SLAVE ADDRESS	0	ACK	SUBADDRESS	ACK	Sr	SLAVE ADDRESS	1	ACK	DATA BYTE Am <sup>(1)</sup>	DATA	NAm	P
---	---------------	---	-----	------------	-----	----	---------------	---	-----	--------------------------------	------	-----	---

**Note**

1. n data bytes with auto-increment of subaddresses.

Each data byte in a read sequence, except for the last one, is acknowledged with Am (acknowledge by the master). The subaddresses 'wrap around' from decimal 255 to 0. If an attempt is made to read from a non-existing subaddress, the device will send a data pattern of all ones, i.e. FF in hexadecimal notation.

## Digital TV Sound Processor (DTVSP)

## TDA9870A

**Table 91** Overview of the slave transmitter registers (note 1)

SUBADDRESS (DECIMAL)	DATA								FUNCTION
	MSB				LSB				
0	s	s	X	X	X	s	s	s	device status (power-on, identification, etc.)
1	X	X	X	X	X	X	X	X	don't care; note 1
2	X	X	X	X	X	X	X	X	don't care; note 1
3	X	X	X	X	X	X	X	X	don't care; note 1
4	X	X	X	X	X	X	X	X	don't care; note 1
5	l	l	l	l	l	l	l	l	level read-out (MSB)
6	l	l	l	l	l	l	l	l	level read-out (LSB)
7	X	X	X	c	c	c	c	c	SIF level
251	a	a	a	a	a	a	a	a	test register 3; note 2
252	a	a	a	a	a	a	a	a	test register 2; note 2
253	a	a	a	a	a	a	a	a	test register 1; note 2
254	d	d	d	d	d	d	d	d	device identification code
255	s	s	s	s	s	s	s	s	software identification code

**Notes**

1. X indicates a bit that has not been assigned to a function. This bit is reserved for future extensions.
2. Registers from subaddress 251 to 255 are for Philips internal purposes only. They are considered as a set of registers for the identification of individual members and some key parameters in a family of devices.

A detailed description of the slave transmitter registers is given in below.

## 10.4.1 DEVICE STATUS REGISTER

## 10.4.1.1 Description

**Table 92** Description of Table 93

NAME	HIGH/LOW	FUNCTION
POR	–	The power supply for the digital part of the device, $V_{DD2}$ , has temporarily been lower than the specified lower limit. If this is detected an initialization of the TDA9870A has to be carried out to ensure reliable operation.
IDSTE	–	this bit is HIGH if an FM stereo signal has been identified
IDDUA	–	This bit is HIGH if an FM dual-language signal has been identified. When neither IDSTE nor IDDUA are set, the received signal has to be assumed to be FM mono.
P1IN, P2IN	–	these bits reflect the status of the corresponding general purpose port pins, see Section 10.3.2

Digital TV Sound Processor (DTVSP)

TDA9870A

10.4.1.2 Definition

10.4.4 REGISTER 3

10.4.4.1 Description

Subaddress 3: These bits have not been assigned to a function. These bits are reserved for future extensions.

10.4.5 REGISTER 4

10.4.5.1 Description

Subaddress 4: These bits have not been assigned to a function. These bits are reserved for future extensions.

10.4.6 LEVEL READ-OUT REGISTERS

10.4.6.1 Description

These two bytes constitute a word that provides data from a location that has been specified with the monitor select register. The most significant byte of the data is stored at subaddress 5.

If peak-level monitoring has been selected, the peak-level monitoring register is cleared and monitoring resumes after its contents has been transferred to these two bytes.

10.4.7 SIF LEVEL REGISTER

10.4.7.1 Description

When the SIF AGC is on, bits B4 to B0 of this register contain a number that gives an indication of the SIF input level. That number corresponds to the AGC gain register setting (see Section 10.3, subaddress 0).

## Digital TV Sound Processor (DTVSP)

## TDA9870A

When the SIF AGC is off, this register returns the contents of the AGC gain register.

## 10.4.7.2 Definition

**Table 96** Subaddress 7

MSB							LSB
B7	B6	B5	B4	B3	B2	B1	B0

## 10.4.8 TEST REGISTER 3

## 10.4.8.1 Description

This register contains, as a binary number, the highest memory address used for the Coefficient RAM (CRAM, expert mode).

## 10.4.8.2 Definition

**Table 97** Subaddress 251

MSB							LSB
B7	B6	B5	B4	B3	B2	B1	B0
0	1	1	1	1	1	1	1

## 10.4.9 TEST REGISTER 2

## 10.4.9.1 Description

This register contains, as a binary number, the highest subaddress used for slave receiver registers.

## 10.4.9.2 Definition

**Table 98** Subaddress 252

MSB							LSB
B7	B6	B5	B4	B3	B2	B1	B0
0	0	1	0	1	1	0	1

## 10.4.10 TEST REGISTER 1

## 10.4.10.1 Description

This register contains, as a binary number, the highest subaddress used for slave transmitter (status) registers.

## 10.4.10.2 Definition

**Table 99** Subaddress 253

MSB							LSB
B7	B6	B5	B4	B3	B2	B1	B0
0	0	0	0	0	1	1	1

## 10.4.11 DEVICE IDENTIFICATION CODE

## 10.4.11.1 Description

There will be several devices in the digital TV sound processor family. This byte is used to identify the individual family members.

## 10.4.11.2 Definition

**Table 100** Subaddress 254

MSB							LSB
B7	B6	B5	B4	B3	B2	B1	B0
0	0	1	0	0	0	1	0

## 10.4.12 SOFTWARE IDENTIFICATION CODE

## 10.4.12.1 Description

It is likely that during the life time of this family of devices several versions of the DSP software will be made, e.g., to accommodate new application concepts, respond to customer wishes, etc. This byte is used to identify the different releases.

## 10.4.12.2 Definition

**Table 101** Subaddress 255

MSB							LSB
B7	B6	B5	B4	B3	B2	B1	B0
0	0	0	0	0	0	1	0

## 10.5 Expert mode

In addition to the slave receiver and slave transmitter modes previously described, there is a special 'expert' mode that gives direct write access to the internal CRAM of the DSP.

In this mode, transferred data contain 12-bit-wide coefficients. As those coefficients bypass on-chip coefficient look-up tables for many functions, they directly influence the processing of signals within the DSP.

This mode must be used with great care. It can be used to create user-defined characteristics, such as a tone control with different corner frequencies or special boost/cut characteristics to correct the low-frequency loudspeaker and/or cabinet frequency responses.

## Digital TV Sound Processor (DTVSP)

## TDA9870A

**Table 102** General format for entering the expert mode and writing coefficients into the TDA9870A

S	SLAVE ADDRESS	0	ACK	10000000	ACK	CRAM ADDRESS	ACK	DATA	ACK	DATA	ACK	P
---	---------------	---	-----	----------	-----	--------------	-----	------	-----	------	-----	---

**Table 103** Explanation of Table 102

BIT	FUNCTION
S	START condition
SLAVE ADDRESS	7-bit device address
0	data direction bit (write to device)
ACK	acknowledge
10000000	pattern to enter the expert mode
CRAM ADDRESS	start address of coefficient RAM to write to
DATA	data byte containing part of a coefficient
P	STOP condition

As the coefficients do not fit into one data byte, they have to be split and arranged (see Table 104). The most significant bit is transferred first.

**Table 104** General format (notes 1, 2 and 3)

BYTE	DATA								DESCRIPTION
1. data byte	a	a	a	a	a	a	a	a	2 MST of 1st coefficient
2. data byte	a	a	a	a	X	X	X	X	1 LST of 1st coefficient

**Notes**

1. X = don't care.
2. MST = most significant third.
3. LST = least significant third.

The general format described in Table 104 shows the minimum number of data bytes required, i.e. two bytes for the transfer of a single coefficient.

Should more than one coefficient be sent, then the CRAM address will be automatically incremented after each coefficient, resulting in writing the sequence of coefficients into successive memory locations, starting at CRAM ADDRESS. A transmission can start with any valid CRAM address. If two coefficients are to be transferred, they are arranged as shown in Table 105.

**Table 105** Transfer of two coefficients

BYTE	DATA								DESCRIPTION
1 data byte	a	a	a	a	a	a	a	a	2 MST of 1st coefficient
2 data byte	a	a	a	a	b	b	b	b	1 LST of 1st coefficient + 1 MST of 2nd coefficient
3 data byte	b	b	b	b	b	b	b	b	2 LST of 2nd coefficient

With any odd number of coefficients to be transferred, the least significant nibble of the last byte is regarded as containing don't care data.

## Digital TV Sound Processor (DTVSP)

## TDA9870A

As the transfer of coefficients cannot be accomplished within one audio sample period, it is necessary that received coefficients be buffered and made active all at the same time to avoid audio signal transients. The receive buffer is designed to store up to 8 coefficients in addition to the CRAM address. Each byte that fits into the buffer is acknowledged with ACK (acknowledge). If an attempt is made to write more coefficients than the buffer can store, the device acknowledges with NACK (not acknowledge) and any further coefficients are ignored. Coefficients that are already in the receive buffer remain intact.

An expert mode transfer ends when the I<sup>2</sup>C-bus STOP condition or a repeated START condition has been detected. Only those coefficients that have been received during the last transmission will then be copied from the buffer to the CRAM.

To make efficient and correct use of the expert mode, it is recommended to transfer all coefficients for any one function in a single transmission.

There is no checking of memory addresses and the automatic incrementing of addresses does not stop at the highest used CRAM address. The user of this expert mode must be fully acquainted with the relevant procedures.

More information concerning the functions of this device, such as the number of coefficients per function, their default values, memory addresses, etc., can be supplied on request at a later date.

### 11 I<sup>2</sup>S-BUS DESCRIPTION

The feature interface of the TDA9870A contains two serial audio inputs and outputs and associated clock signals. It can be used to supply, for example, audio signals from received TV programs to a digital audio output device (AES/EBU format), or import serial audio signals from other sources for reproduction through the TV set's loudspeaker and/or headphone channels. Apart from such simple data input or output, it is also possible to run audio signals through an external DSP, which performs some additional functions, such as room simulation, Dolby Surround Pro Logic etc. and feed those signals back into the loudspeaker and/or headphone channels of the TDA9870A.

Two serial audio formats are supported at the feature interface, i.e. the I<sup>2</sup>S-bus format and a very similar MSB-aligned format. The difference is illustrated in Fig.7.

In both formats the left audio channel of a stereo sample pair is output first and is placed on the serial data line (SDI for input, SDO for output) when the word select line (WS)

is LOW. Data is written at the trailing edge of SCK and read at the leading edge of SCK. The most significant bit is sent first.

At power-up, the outputs of the feature interface are 3-stated to reduce EMC and allow for combinations with other ICs. If output is desired, it has to be activated by means of an I<sup>2</sup>C-bus command.

When the output is enabled, the serial audio data can be taken from pins SDO1 and SDO2. Depending on the signal source, switch and matrix positions, the output can be either mono, stereo or dual language sound on either output.

The word select output is clocked with the audio sample frequency at 32 kHz. The serial clock output (SCK) is clocked at a frequency of 2.048 MHz. This means, that there are 64 clock pulses per pair of stereo output samples, or 32 clock pulses per sample. Depending again on the signal source, the number of significant bits on the serial data outputs, SDO1 and SDO2, is between 14 and 18.

Apart from just feeding a digital audio device, such as a DAC or an AES/EBU transmitter, the serial data outputs can be connected directly to the serial inputs (loop-back connection) or first to an external device, e.g. a feature DSP such as the SAA7710 and then back to the serial inputs. In all of these configurations, the SCK and WS clocks will be generated by the TDA9870A, which then is the I<sup>2</sup>S-bus master.

The serial data inputs, SDI1 and SDI2, are active at all times, independent of the serial data outputs being on or off. When the serial data outputs are off (either after power-up or via the appropriate I<sup>2</sup>C-bus command) serial data and clocks WS and SCK from a separate digital audio source can be fed into the TDA9870A, be processed and output in accordance with internal selector positions, provided that the following criteria are met:

- 32 kHz audio sample frequency
- 32 clock bits per sample
- External timing and data synchronized to TDA9870A.

In such cases, the external source is the I<sup>2</sup>S-bus master and the TDA9870A is the I<sup>2</sup>S-bus slave.

To support synchronization of external devices or as a master clock for them, a system clock output, SYSCLK, is available from the TDA9870A. At power-up it is off. It can be enabled and the output frequency set via an I<sup>2</sup>C-bus command. Available output frequencies are 8.192, 12.288, 16.384 and 24.576 MHz.

### 15 SOLDERING

#### 15.1 Introduction

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our "IC Package Databook" (order code 9398 652 90011).

#### 15.2 Soldering by dipping or by wave

The maximum permissible temperature of the solder is 260 °C; solder at this temperature must not be in contact with the joint for more than 5 seconds. The total contact

time of successive solder waves must not exceed 5 seconds.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified maximum storage temperature ( $T_{stg\ max}$ ). If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

#### 15.3 Repairing soldered joints

Apply a low voltage soldering iron (less than 24 V) to the lead(s) of the package, below the seating plane or not more than 2 mm above it. If the temperature of the soldering iron bit is less than 300 °C it may remain in contact for up to 10 seconds. If the bit temperature is between 300 and 400 °C, contact may be up to 5 seconds.

### 16 DEFINITIONS

<b>Data sheet status</b>	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
<b>Limiting values</b>	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
<b>Application information</b>	
Where application information is given, it is advisory and does not form part of the specification.	

### 17 LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.

### 18 PURCHASE OF PHILIPS I<sup>2</sup>C COMPONENTS

Purchase of Philips I<sup>2</sup>C components conveys a license under the Philips' I<sup>2</sup>C patent to use the components in the I<sup>2</sup>C system provided the system conforms to the I<sup>2</sup>C specification defined by Philips. This specification can be ordered using the code 9398 393 40011.
