Silicon Unilateral Switch

- Applications:**
- SCR Triggers
 - Frequency Drivers
 - Ring Counters
 - Cross Point Switching
 - Over-Voltage Sensors

TO-98

The GE/RCA 2N4987-90 SUSs are planar monolithic silicon integrated circuits having thyristor electrical characteristics closely approximating those of an "ideal" four layer diode. The device is designed to switch at 8 V with a 0.02%/°C temperature coefficient. A gate lead is provided to eliminate rate effect, obtain triggering information at lower voltages

and to obtain transient free wave forms.

Silicon Unilateral Switches are specifically designed and characterized for use in monostable and bistable applications where low cost is of prime importance. These types are supplied in JEDEC TO-98 package.

Devices in TO-98 package are supplied with and without seating flange (see Dimensional Outline).

MAXIMUM RATINGS, Absolute-Maximum Values:

PEAK REVERSE VOLTAGE	30 V
PEAK RECURRENT FORWARD CURRENT (1% duty cycle, 10µs pulse width, T _A = 100°C)	1 A
PEAK NON-RECURRENT FORWARD CURRENT (10µs pulse width)	5 A
DC FORWARD ANODE CURRENT (Note 1)	175 mA
DC GATE CURRENT (Notes 1 and 2)	5 mA
POWER DISSIPATION (Note 1)	300 mW
JUNCTION TEMPERATURE RANGE	- 65° to + 125°C
STORAGE TEMPERATURE RANGE	- 65° to + 150°C

NOTES:

1. Derate linearly to zero at 125°C.
2. This rating applicable only in OFF state.
Maximum gate current in conducting state limited by maximum power rating.

T. 25-09

APPLICATIONS

Uses fewer components than transistor flip flops. Output at "B" gives transient free waveform.

Switching action of the 2N4990 allows smaller capacitors to be used while achieving reliable thyristor triggering.

Fig. 15 - Binary divider chain circuit.

Fig. 16 - Motor speed control circuit.

SUS is used to generate a rapid rise or fall time by using energy stored in a capacitor.

APPLICATIONS (Cont'd)

For overvoltages, SCR turns on and blows fuse. For rapidly rising voltages, circuit triggers between 13.2 & 14 volts. For slowly increasing voltages, circuit triggers between 14 & 17 volts.

Fig. 19—Overvoltage protection circuit.

Capacitor charges until switching voltage is reached. When SUS switches on, inductor causes current to ring. When current thru SUS drops below holding current, device turns off and cycle repeats.

Fig. 20—10 kHz oscillator circuit.

Spikes in center of sawtooth are eliminated in this circuit by triggering at gate.

Fig. 21—Frequency divider circuit (with transient-free output).

Sawtooth Output from each stage is one half frequency of preceding stage.
